This study was conducted to develop a model in which the resources accounted for under the Uniform Cart of Accounts (UCA) can be paired with Diagnosis Related Groups (DRG) and subsequently assigned to Major Disease Categories. The cost data were collected on one Major Disease Category and computed under both the UCA and DRG systems. The costs were compared to each other and against national averages. The study found a significant cost savings to the government when comparing actual costs and national averages. The study concluded that inefficiency is rewarded under the current system of UCA and converting to DRGs would reward efficiency in medical care.

ACKNOWLEDGEMENTS

I owe a debt of gratitude to many people for their help during the conduct of this research effort. First, I would like to thank my preceptor, Lieutenant Colonel Jack E. Bradford, who provided me with expert guidance, encouragement, and ready access whenever I needed his assistance. The hospital commander, Colonel Seymour Levine, also supported me and saw that I had all the resources necessary to complete this study. Without the assistance of these two individuals, this project would not have been successful.

The support of Major Stuart Baker and the Health Care Studies and Clinical Investigation Activity has also proven to be invaluable in the collection of data and identification of inpatient cases which were selected for this study.

Mrs. Betty Lewis, the librarian, graciously honored my every request for literature and her tireless efforts in obtaining publications are certainly appreciated. Mrs. Vada Gordon, the UCA systems manager; Captain Brian Knapp, the Comptroller; Mrs. Aleta Perkins and Mrs. Penny J. Maggio of the Comptroller Division did much to establish for me how the current fiscal accounting and Uniform Staffing Methodology (manpower) systems operate. Mrs. Mary Fisher, Chief of the Medical Records Administration Branch, tutored me endlessly on how the International Classification of Diseases serves to code diagnoses of patients who are undergoing treatment. Captain Richard Boggan, Chief of the Nursing Education and Training Service,

taught me the nursing model for acuity of care and coded each of the 94 cases in the study by day, through their lengths of stay to permit me to identify the number of direct care nursing hours. Other members of the Medical Activity staff who have contributed to my learning experiences during the residency year and during this research project are too numerous to mention, but I would like to express my sincere appreciation to them as well.

Certainly the support given to me by my reader, Chaplain (MAJ) William Caple and other various members of the Baylor Faculty should also be mentioned. Their critical remarks involved in the preparation of the final text presenting my research have been constructive and much appreciated.

Finally, I would like to thank my wife, Janet Carol, who has been a constant source of strength during this project and throughout the two years of graduate study. Her encouragement, assistance, and sacrifice as she undertook roles as mother, father, and home-maker in raising our children, Andrew Jr. and Rebecca, to enable me to pursue this research effort to completion have been the catalyst which has kept me going.

I. INTRODUCTION

GENERAL

Studies in health care, health care administration, and health care costs are made difficult by numerous abstract concepts. Since this study deals primarily with health care costs and performance data, it is important to start with the most fundamental of definitions - "Health".

Health is a physical, mental, and social state which exists in living beings.[1] There are infinite states between excellent and poor health. An example of someone in excellent physical health might be an Olympic athlete. At the other extreme someone in poor physical health might be an aged, chronically or acutely ill individual who is near death. The perception of health is different among individuals. An individual might feel fine at the same time his physician considers him "not well". A mother might be concerned with a low grade temperature spiked by one of her children during the flu season and rush to the physician only to be told that the child is reasonably well and not to be concerned.

Health care is generally not an issue until an individual perceives that he is "not well". It is at this point that the individual might choose to utilize the health care system. Self care (taking two aspirins for a sore throat) is vastly different from seeing an internist for some exotic disease which has a sore throat as one of its symptoms. Individuals who perceive that

they are sick, therefore, might access different levels of health care ranging from self care through inpatient care in a tertiary treatment facility (medical center (teaching) hospital). Numerous other levels of care which exist between these polar extremes are, but are not limited to: unprofessional care (wife, friend, or the like), professional care (an outpatient clinic), nursing home care, and inpatient care in a secondary treatment facility (community hospital).

Attempting to measure the resources employed in providing health care gives rise to additional issues which are a function of the level of care being provided (self care versus tertiary treatment facility care, for example) and the adequacy of care. In this research project, the level of care will be assumed to be one in which there is a medical institution providing care which has in place accounting mechanisms to reflect where resources are being expended.

Adequacy of care is a judgmental concept that is objectively very difficult to define. A provider or hospital that is being reasonably reimbursed might consider adequate health care to be everything the patient wants. Conversely, if there is no reimbursement mechanism in place, a provider or hospital might seek to minimize the care he/it is willing to provide. Consider the magnitude of a general systems theory of health care[2] as shown in Figure 1.

An effective manager must successfully manage the rather complex task of blending the "inputs" of the health care process to efficiently produce first the intermediate outputs and then the final outputs. In order to continue as a successful business

activity, a health care facility's reimbursements for services provided must match its expenses. It is academically unimportant which outputs, intermediate or final, are paid for by consumers. The point is that adequate pay must be received for "adequate care".

GENERAL SYSTEMS THEORY APPLIED TO HEALTH CARE

Inputs =	Process =	Intermediate Outputs =	Final Outputs
Equipment	Clinic Visits	Patients Treated	Completed Treatments
Supplies	Inpatient Bed Days	Pharmaceuticals Dispensed	Reports
Personnel	ER Care	Lab Tests	Well Patients
Facilities	Preparation of Medications	X-Rays	Trained Personnel
Management Expertise	Meal Preparation	Occupied Bed Days	.....
Patients	.....	Nutrition Care	.....
...		....	.....
...			
...			

FIGURE 1

In the past the focus of health care managers has been on intermediate outputs. In civilian facilities, payment for health care is made by individual patients, the Federal Government, or third party payers (insurance companies). Cases for which no payments are received are labeled charity care and must be borne by the other payers. This "hidden tax" is referred to in the literature as cost shifting.[3] Obviously the parties making payment would prefer to pay for only the care rendered to their particular cases. Consequently, some third party payers do not pay full cost or charges. Blue Cross negotiates the "charges" which they will pay for care rendered to Blue Cross beneficiaries. Medicare and Medicaid also do not pay a full charge bill (by Legislative Edict).[4]

A move by Medicare in October 1983 to pay prospectively for (inpatient) health care marked a major change in the health care system. The risk of health care costs began to shift from payers to providers as final products became the focus of the health care system[5] (see Figure 1). Consumers started paying a fixed, prospective price for the final products or total treatment regimens catalogued in 470 Diagnosis Related Groups (DRGs).[6] Prospective reimbursement by DRG has replaced cost reimbursement in the Medicare/Medicaid arenas.[7] In some states Blue Cross has also adopted a DRG reimbursement system.[8] The Veterans' Administration has already moved to a DRG based budget allocation program - voluntarily.[9] It is quite possible that medical treatment facilities (MTFs) in the Department of Defense (DOD) will soon follow suit - either voluntarily or by Congressional mandate. Under prospective reimbursement, billing for intermediate products is eliminated. A simple illustration of a retrospective hospital billing system is shown below:

RETROSPECTIVE HOSPITAL BILLING SYSTEM

Work Units	Quantity	Charge/ Work Unit	Total Work Unit Charges
Bed Days	22	$451.00	$9922.00
Weighted Laboratory Procedures	67	$13.50	$894.00
Weighted Radiology Procedures	46	$24.50	$1127.00
Weighted Pharmacy Procedures	121	$7.25	$877.25
Total Hospital Bill			$12820.25

FIGURE 2

If this same care episode belonged to DRG #191 (Major Liver, Pancreas, and Shunt Procedures), its prospective payment would have been worth about $10,692 at central Virginia hospitals. It is easy to understand how providers would be enticed to minimize the intermediate products to the lowest level possible which still affords quality health care[10]

Accounting for health care costs is performed in military treatment facilities by a system entitled, "The Uniform Chart of Accounts"(UCA). Using the UCA, workload performance and costs are measured in terms of intermediate products (e.g. laboratory tests, radiographic procedures, pharmaceuticals dispensed, hospital bed days and others) and are aggregated into cost centers. These cost centers, under the present system, are the separate Departments and Clinics of an MTF which are allocated funds to perform their missions.[11] The UCA does not account for workload or expense information by respective cases or episodes of care. Theoretically, cost per episode of care could be determined by summing the cost of the intermediate outputs for each case (patient) treated.

Just as cost shifting occurs in civilian hospitals, it also occurs in the military. The issue in the military is not of billing consumers, but rather, is one of avoiding wasteful management practices. The tax paying American public should have no problem in paying a fair cost for a sick soldier's care at a military hospital, but when costs not directly related are added, there is room for taxpayer concern. Added onto the productive function of caring for eligible beneficiaries are many other expenses. Examples of these other expenses are: Temporary Duty

(TDY) of a physician attending a professional conference, committee meetings, physical training time, coffee breaks, time off to run to the Post Exchange, Security Briefings, and Field Training Exercises (FTX's). The prudent manager should seek to limit other acceptable costs (OAC) to some level that can be justified. If there is a "profit" in military health care, it might be in terms of the margin of other acceptable costs which can be afforded based upon productive health care workload. In this project it will be contended that this "profit" should be no more than some specified fraction (e.g. 25%) of total costs. It becomes clear that the most important issue to be answered is: "How does one determine the true, direct costs of military health care?"

CONDITIONS WHICH PROMPTED THE STUDY

The principal stimulus for this research effort was extra-institutional. Now that health care expenditures exceed ten percent of the Gross National Product (GNP), there is an increasing amount of public interest in controlling costs.[12] The desire to control costs is not easily fulfilled. There is a functional relationship between services desired and their costs. In economic terms these services are demanded by the willingness of consumers to pay for them. It would seem to be intuitively obvious that as more health services of increasing complexity, technology, and expense are "demanded", health care costs will continue to increase. The paradox is clear. Technology and

medical skills encourage use of health care services. Concurrently, the demand for those health care services must be decreased in order to reduce health care costs.

As political pressures increase to control the size of the DOD budget and to control health care costs in general, it is easy to predict that managers of the military health care system will seek ways to improve cost efficiency.[13,14,15,16] This researcher had a desire to explore the anticipated changes which would occur in the Army Medical Department (AMEDD) if budgeting were based on a prospective model similar to the DRG system currently employed for Medicare reimbursement. If AMEDD facilities were rewarded for cost efficiency by being allowed to spend any operational gains as they saw fit or if managers were evaluated (via Officer Efficiency Reports) with regard to their performance, it is easy to predict that they would be more productivity oriented. A central issue in this study is that the accounting system developed under the Uniform Chart of Accounts should be retained and modified to provide MDC and/or DRG information. Since expense data is being quite effectively captured under the UCA, the system warrants being kept. The problem is that the expenses are not being matched against performance data, but rather, performance (cost) centers.[17] In the future, it may be the treatment episodes (or final products) and not the cost centers which are funded.[18] Instead of allocating x dollars to the Department of Surgery, for example, y dollars will be funded for each appendectomy, and z dollars for each heart by-pass operation.

The mathematical model developed will also propose a variable (OAC or Other Acceptable Costs) for those nonproductive functions which military facilities must undertake to fully perform their missions (e.g. military training, physical training, and committee meetings).

Much work in the area of performance measurement has already been done by a special task force working under a charter from The Surgeon General of the United States Army. The Task Force, the US Army Health Care Studies and the Clinical Investigation Activity (HCSCIA), is attempting to develop a better model than the currently used Medical Care Composite Unit (MCCU) to measure workload performance by Army medical treatment facilities.[19] The main thrust of this HCSCIA study is toward Army Medical Department (AMEDD) inpatient workload. By comparison, this graduate research project is a limited effort to match the resources applied to the respective inpatient cases of a single MDC which were treated at Kenner Army Community Hospital (KACH) during 1984. HCSCIA provided original data to the research project by identifying cases of the 1984 KACH workload which belong to the MDC that was selected at the outset of the project. Assuming that automated equipment which is currently used in maintaining the UCA can be made available in the future to capture and manipulate data regarding health care resources, this model could readily be adapted to all MDCs and added to the UCA as a software change package. There are already functional automated systems (i.e. Pharmacy, Pathology, Radiology, and Personnel Utilization) that record cost/performance factors used

in support of the Uniform Chart of Accounts. This model will be suggested for use throughout the Department of Defense (DOD).

LITERATURE REVIEW

References supporting this study were drawn from two general areas. The vast majority of the literature dealing with military MTF cost and performance accounting is specific to the uniformed services. Non-military references are important to the concept of Major Disease Categories (MDCs) and Diagnosis Related Groups (DRGs). The principal literature references from both the military and non-military areas are briefly reviewed below.

The Uniform Chart of Accounts (UCA) was established by Department of Defense (DOD) Directive 6010.10 which was entitled, "Uniform Chart of Accounts for Fixed Military Medical and Dental Treatment Facilities", dated 19 May 1979. The effective date was 1 October 1979, and it was mandatory for use by all DOD fixed military medical and dental treatment facilities. The UCA, also known as "The Uniform Resources and Performance Accounting System for DOD Medical Operations", is designed to provide consistent principles, standards, policies, definitions, and requirements for expense and performance accounting and reporting by DOD fixed military medical facilities. Available from this system are uniform performance indicators, common expense classification by work centers, and a cost assignment methodology.[20]

Health care resources are costed and accounted for by the UCA methodology. Workload performance of health care services is likewise measured by the UCA methodology. Performance

factors vary among the different departments. The Pharmacy Department produces weighted procedures as does the Radiology Department and the Pathology Department. Linen Service performance is measured as pounds of linen processed. Department of Nursing support is based upon hours of nursing care rendered. The list of examples seems almost endless. At a small Army Community Hospital such as Kenner (121 beds) there are 206 separate UCA accounts. A listing of these is at Appendix B. The UCA permits the derivation of average cost per work unit. Determination of specific resource requirements, such as manpower, starts with identification of services to be provided, as indicated on the mission list. The mission list for Kenner Army Community Hospital is at Appendix C.

Once a particular service is defined in the mission statement, the level of staffing and the grade (rank) structure which is required to support that service is determined by the Uniform Staffing Methodology (USM). Existing Department of Defense and Army Directives regarding the USM are: DOD Directive 6010.11-M, Uniform Staffing Methodology for Fixed Medical Treatment Facilities and Dental Treatment Facilities; Army Regulation 570-4, Manpower Procedures Handbook; Department of the Army Pamphlet 570-4, Manpower Procedures Handbook; Department of the Army Pamphlet 570-577, Staffing Guide for US Army Medical Department Activities; and Department of the Army Pamphlet 40-XX, Uniform Staffing Methodology. Under the mechanism of the USM, work is measured by a "performance yardstick" which varies between departments but generally includes things like the number

of hours worked, the number of patients seen, and the number of weighted pharmaceutical, laboratory, or radiographic procedures performed. Performance yardsticks are used to establish the skills and number of personnel who are required to operate a given service.

Having captured performance and expense data by the Uniform Chart of Accounts and having established the manpower requirements to support the existing workload in accordance with USM, the Automated Source Data Collection System (ASDCS) becomes the next most necessary concept to understand in the accounting system. ASDCS has been implemented to support the administrative function of collecting workload statistics. It is an element of the UCA and consists of Pharmacy, Pathology, and Radiology components. ASDCS is supported under a contract with Federal Data Systems Corporation. Desk guides and supporting documentation are provided by the contractor. These user guides and manuals will be referenced as required.[21]

Pharmacy, Pathology, and Radiology components, also referred to as the Ancillary Services, measure cost of their respective departments and capture workload as weighted units. Consider the Pathology Department. The College of American Pathologists (CAP) has listed all of the procedures which a laboratory might perform and has established weights for each procedure. These weights are a reflection of resource intensity required for the procedures performed. Extracted pages from the listings of procedures with their respective weights for the three ancillary services are attached at Appendix D.

The Uniform Chart of Accounts Personnel Utilization System (UCAPERS) is a combination of UCA and USM systems. It was developed under DOD Contract MDA903-82-C-0200 dated 1 September 1984 by Federal Data Systems Corporation for the Office of the Assistant Secretary of Defense (Health Affairs) and the Army Medical Department. This system has recently been installed in Army Medical Treatment Facilities. Instructions and guidelines for this system are being provided by the contractor. UCAPERS is designed to report statistical information regarding manpower utilization through the Expense Assignment System Preprocessor (EASPP).

Moving out of military specific literature and into more general civilian references, assigning diagnoses into DRGs and MDCs is becoming an increasingly more common practice. Title VI of Public Law 98-21 (Social Security Amendments of 1983) added a section to the Social Security Act establishing a prospective payment system for Medicare payment of inpatient hospital services. Under the new system, Medicare payments are made at a predetermined rate for each discharge. These predetermined rates were set by Congressional Act. Their evolution was from a Yale University Study which was begun in the late 1960's. Discharges are grouped by related diagnoses called Diagnosis Related Groups. Of all potential discharges there are 470 specific DRGs into which any given diagnosis must be classified.[22] Each of the 470 DRGs has a weighted value which is a reflection of the resource intensity which is required to support it. Additionally, each DRG has a statistically determined Average Length of Stay. To establish the dollar value of any given DRG, the weighted value

of that DRG is multiplied by the blended case mix figure. The blended case mix figure is a single index figure for the average cost of an average inpatient's hospital stay. It is a reflection of the degree of complexity a given hospital maintains in its workload. There is a federal portion and a hospital specific portion, each of which consists of Labor and Non-Labor Components. Sample calculations of a Blended Rate Figure are shown at Appendix E. It follows that a DRG with a high weighted value is worth more than a DRG with a low weighted value. Section 1886 (d)(1)(A) of the Social Security Act provides for a transition period of three years during which a prospective payment rate, originally based upon historical hospital costs, is gradually changed to a national average cost for each diagnosis.[23]

The DRG system was created as an attempt to provide an effective framework for monitoring the quality of care and the utilization of services in a hospital setting. The first major application of DRGs was in the late seventies in the state of New Jersey. DRGs provided an operational methodology for defining and measuring a hospital's case mix complexity. Fundamental concepts employed in defining case mix complexity are: 1) severity of illness, 2) prognosis, 3) treatment difficulty, 4) need for intervention, and 5) resource intensity. The purpose of DRGs is to relate a hospital's case mix to the resource demands and associated costs experienced by the hospital.[24]

DRGs are, as the name implies, groups of "related" diagnoses. Initially, the Commission on Professional and

Hospital Activities (CPHA) divided all possible diagnoses into 349 mutually exclusive "major" diagnostic categories, each with 20 subcategories. This yields over 7000 patient classes.[25] There are even more diagnostic codes under the International Classification of Disease Adapted for Hospital Use 9th Edition, Clinical Methodology (ICDA-9-CM).[26] The large number of diagnosis classifications under CPHA and ICDA-9-CM methodologies presented operational problems. Consequently, another system of 23 mutually exclusive Major Disease Categories (MDCs) that roughly parallel the major body systems (e.g. circulatory, respiratory, etc.) was developed for principal diagnosis areas. There are 470 DRGs grouped under these 23 MDCs. Each DRG represents a statistical average of similar diagnoses from the ICDA-9-CM system. As stated earlier, the DRGs represent a hospital's case mix which is then matched to the resource demands and associated costs.

STATEMENT OF THE PROBLEM

To provide a management tool by developing a model in which the resources accounted for under the Uniform Chart of Accounts can be paired with Diagnosis Related Groups, and subsequently assigned to Major Disease Categories.

OBJECTIVES

The objectives of this research project were:

1. To accomplish the tasks indicated below:
    a. To examine the composition and structure of the

Uniform Chart of Accounts (UCA). (UCA is designed to capture workload and expense data.)

b. To examine the current regulation(s) regarding Uniform Staffing Methodologies (USM). (USM is designed to capture manpower data.)

c. To review the methodology of the Uniform Chart of Accounts Personnel Utilization System (UCAPERS) in combining UCA and USM information.

d. To review the methodology of assigning diagnoses for disease injury and illness to codes of the International Categorizaiton of Diseases Adapted for American Hospital Usage, 9th Edition, translating those codes to ICDA-9-Clinical Methodology Edition, assigning the ICDA-9-CM codes to one of the specific 470 DRGs and then assigning the DRGs to one of the 23 MDCs.

2. To select a particular MDC for study.

3. To illustrate how the Automated Source Data Collection System (ASDCS) can be used in collecting and manipulating UCA data. Pharmacy, Pathology, and Radiology data will be taken from the ASDCS currently in use at KACH. (USM data will be taken from the UCA quarterly reports.)

4. To select a department at Kenner Army Community Hospital (KACH) for the proposed study.

5. To portray in a mathematical model the relationship between expense data as recorded by the UCA and performance data as indicated by the DRGs which were supported.

CRITERIA

The criteria of this research project were:

1. Of all inpatient cases supported in 1984, 99% must be assignable to DRGs and, subsequently, to MDCs.

2. The MDC selected for study must be supported by KACH seven to eight times per month with certain DRGs being supported fifteen to thirty times per year.

3. Expenses of key participants in supporting each of the cases identified for the study must be determined.

4. Verifiable costs for each episode of care must be determined.

5. Average DRG costs must be established.

6. A formula which uses average DRG costs must be developed to predict an MDC cost as a function of the frequency that each DRG is supported.

ASSUMPTIONS

The following assumptions were made for the conduct of this study and were predicated upon data provided by the Uniform Chart of Accounts.

1. The UCA currently captures and effectively allocates hospital expenses to particular cost centers.

2. The UCA system accurately reflects workload performance of the respective cost centers.

3. The recently installed ASDCS system at KACH, with only minor modification, could make possible the entry and manipulation of data in accordance with the design of this model.

4. Patients treated by KACH will be assumed to be representative of the entire local patient population.

5. The hospital and staff at KACH will cooperate and support this study to the fullest extent possible.

LIMITATIONS

The following factors restricted the researcher in the conduct of this study.

1. Due to the numerous 4 Digit UCA codes in the accounting system and the complex interrelationships of DRGs within an MDC, this model will be limited to not less than 4 and not more than 12 UCA codes.

2. Only one MDC will be selected and developed in the model in order to keep the study manageable.

3. The study will be limited to inpatient workload in order to keep its size manageable.

4. Due to budgetary constraints this entire study will be performed at KACH.

5. Data from Calendar Year 1984 will be used to determine cost/DRG/MDC relationships.

6. Institutional operation of the UCA will initially remain unchanged, requiring that the model conform to the framework of the UCA. (Information required will have to be manually extracted from UCA reports.)

RESEARCH METHODOLOGY

The steps to accomplish the research objectives were as follows:

1. The mechanics of the current UCA accounting system will be discussed. How it works will be described using an organization structure model. Components of the UCA will also be discussed. These components will be: the use of Medical Care Composite Units (MCCU's), the Step-Down Assignment Statistic (SAS), the Automated Source Data Collection System (ASDCS), and the Uniform Chart of Accounts Personnel Utilization System (UCAPERS). Because the UCAPERS component of the UCA is important in assigning hours of support to particular cost centers, its relationship to Uniform Staffing Methodology will also be discussed.

2. The (23) MDCs will be introduced and a concept developed in how budgeting might be done using them as a system of accounting. MDC #7, Diseases and Disorders of the Hepatobiliary System and Pancreas, will be selected for study. It is an MDC which is frequently supported by KACH (7 to 8 times per month); it is often treated by a single service (Surgery); and it is projected to occur frequently enough (15 to 30 cases in selected DRGs per year) to provide a statistically valid sample.

3. The relationship and differences of ICDA-9 to ICDA-9CM will be described. Use of a model to transition from ICDA-9 to ICDA-9CM developed by the Health Care Studies and the Clinical

Investigation Activity of Health Services Command will be employed to assign the ICDA-9 codes to the 18 DRGs of MDC #7. These DRGs are #191 - #208.

4. A list, by DRG, of all ICDA-9 codes, performed by KACH in 1984, belonging to MDC #7 will be prepared.

5. A study of the inpatient support given to each of the ICDA-9 codes (cases) belonging to MDC #7 will be performed in order to determine the cost of the total support given to each case.

a. Initially the inpatient services will be paired with the cases identified for the study. In fact, this includes Medical Service, Surgical Service, Gynecology Service, and Psychiatry Service. Costs will be roughly estimated as a function of the service specific cost per occupied bed day (provided from quarterly UCA reports) and the length of stay (obtained from the medical record).

b. A more refined cost per case will then be established by reviewing the medical records and determining the cost of support provided by the "key participants" to each of the cases. The Ancillary Services (Pharmacy, Pathology, and Radiology), Nursing Staff, Operating Room Staff, Recovery Room Staff, and Anesthesiology are the key participants which will be identified. All "Other Supporters" will remain in a single general category. Costs per performance unit (e.g. weighted procedures, nursing acuity of care categories (Nursing Care Hour Standards Study[27]), hours of care, and occupied bed days) will be determined. This cost per performance unit will then be applied to the workload (number of performance units) supporting each

case based upon documentation found in the medical record. From UCA methodology,[28] workload and expense data will be paired with the workload units per case as identified in the medical records to derive the following formulas:

Workload units per case/Total UCA code workload reported x 100
= % UCA Code workload per case

% UCA code workload/case x Total expense of UCA code =
Cost of UCA code's contribution to the case

6. The total cost of each case will be determined by collecting the total cost of each department's support to that case. Using the previous formulas, it will be proposed that the estimated cost for a given case can be obtained from the following formula:

$$a(DxA) = aa'U1 + aa''U2 + aa'U3 + ...aa'Un$$

Where a = the number of cases of DxA treated
DxA = the average cost of treating Diagnosis A
a' = the proportion of the indicated UCA Codes supporting DxA.
U1 = UCA Cost of Contribution from Department 1
U2 = UCA Cost of Contribution from Department 2
U3 = UCA Cost of Contribution from Department 3
Un = UCA Cost of Contribution from Department n
Where n is the aggregation of all other supporting departments.

Costs of cases or diagnoses belonging to the same DRG will be added and averaged to determine an average DRG cost. Additionally, a 95% confidence interval will be calculated for each average DRG cost in order to indicate how well that average cost represents the "universe" of cases belonging to that DRG. These average DRG costs will be used as "normal" values in the mathematical model for the MDC's cost. (These "normal" values should be reviewed and updated with expansion of the data base.)

7. The following formula for MDC #7 resource requirements will be developed from the aggregated average costs of each DRG:

Resources allocated to MDC #7 =
a(DxA) + b(DxB)+c(DxC) + ...n(DxN) + OAC

Where a = the number of cases of DxA treated
DxA = the average cost of treating DRG A (For MDC #7 the first DRG would be #191)
b = the number of cases of DxB treated
DxB = the average cost of treating DRG B
c = the number of cases of DxC treated
DxC = the average cost of treating DRG C
n = the number of cases of DxN treated
DxN = the average cost of treating the last DRG of the MDC (for MDC #7 this would be DRG #208)
OAC = Other acceptable costs (i.e. PT, Unit Training, Committee Meetings, and Admin/Log Functions). The OAC will be expressed as a percentage of productive Dx costs (i.e. .25(a(DxA) + b(DxB)+c(DxC) + ...n(DxN))

(The formulas in 5b, 6, and 7 were derived and are proposed by the researcher.)

The OAC variable is intended to be used as a "profit margin". "Profit" earned in productive care must be sufficient to cover the necessary nonproductive activities. If budgeting were done by DRGs/MDCs the amount allocated would be prospectively set. This implies that if cases cost more than the resources allocated to them, the OAC variable would be negative in order for the formula to be true. The .25 figure is a random number. Commanders would have to establish, after careful study, the level at which to set resource allocations. This level should be objectively established with some maximum allowable fraction for "non-productive" activities.

8. KACH's cost per DRG will be compared to a nearby civilian hospital's DRG prospective reimbursement values in order to place the information obtained from the study in perspective with civilian health care literature.

II. DISCUSSION

MECHANICS OF THE UNIFORM CHART OF ACCOUNTS

The origin of the Uniform Chart of Accounts was previously mentioned in the Literature Review. DOD health care managers are expected to use the UCA for establishing a uniform reporting methodology that provides consistent financial and operating performance data. There are two areas in which the present system falls short: 1) the reporting system is not totally uniform between services (Army, Navy, and Air Force) or even between facilities in the same service even though this was the original intent;[1] 2) while fairly successful in reporting relatively uniform performance and expense data, the system falls short of reporting costs per patient treated.[2] The UCA does report in which departments or clinics expenses occur, but it does not match expenses to the cases which they support.

Perhaps the easiest way to explain the UCA is to imagine a single checkbook from which a military hospital operates. From this checking account, specific elements of expense are paid to subaccounts labeled UCA codes (e.g. BBAPA = Dermatology, BAAXA = Inpatient ICU/CCU, and so forth). An audit trail can be established to determine the amount of money spent on each element of expense (e.g. manpower, supplies, equipment, and travel) in a given period of time. Furthermore, each department, branch, section, or activity can be monitored with regard to resources consumed.

A listing of the UCA codes or accounts to which expenses are assigned at Kenner Army Community Hospital is at Appendix B. The UCA accounts parallel the hospital's organizational structure[3] which is generally illustrated at Appendix F. Just as command and control flow downward along the schematic of the organizational structure, so also does the hospital's operating budget. Monies provided to the facility for its operation are divided under the commander's authority and provided to each department, branch, section, and activity.

In accordance with HSC Supplement 1 to Army Regulation 37-100-86, Financial Administration; The Army Management Structure (AMS), performance or workload is measured by a unit of measure called the Medical Care Composite Unit (MCCU). MCCUs are earned in four ways. First, 10 MCCUs are earned for each hospital admission. Second, 10 MCCUs are earned for each live birth. Third, 1 MCCU is earned for each occupied bed day. Fourth, .3 MCCUs are earned for each outpatient clinic visit.

The desire of a manager to match his inputs (resources made available) of the health care process to outputs (patients treated or services provided) is not well served by the MCCU mechanism. A short term admission of a patient for elective surgery in which there is no complicating concurrent illness is vastly different from a long term admission of an elderly patient with numerous chronic, concurrent illnesses to the ICU. These two admissions are both worth 10 MCCUs but the ultimate cost of treatment is much greater for the ICU patient. Consider an inpatient (occupied bed day) in the ICU as compared to an inpatient on a minimal care ward. The ICU patient may be

receiving continuous care and monitoring by 2 nursing staff personnel 24 hours per day while the minimal care patient has a cursory visit from an aidman twice a day to obtain and record vital signs. Certainly these two inpatients are not receiving the same care but both are receiving 1 MCCU credit per hospital bed day. An outpatient clinic visit in Internal Medicine is very different from one in Dermatology or the Outpatient Clinic. An Internal Medicine visit may take an hour or more and involve a number of laboratory tests, an EKG, numerous prescriptions, and other services. A Dermatology appointment might take 10 minutes and result in a prescription for a topical ointment. While it can easily be argued that the two are not the same, they are both afforded .3 MCCU credits.

The point is that health care is too heterogenous to be lumped into just four general classifications. Specific costs must be determined on a case-by-case basis. The Uniform Chart of Accounts does allocate expense data to the various cost centers, and it does, with the help of MCCUs, <u>crudely</u> measure performance data. Indirect costs originally allocated to intermediate accounts (e.g. linen service, nutrition care, and administrative/personnel services) are distributed to final expense accounts (patient care or "productive" cost centers) by way of a technique called "The Step Down Assignment Statistic" (SAS). The UCA system does not provide accurate data on a case-by-case basis as to the cost of treating any particular patient. Efforts by managers to economize their resources are hindered by not knowing, or being able to establish, the total cost of treating any particular type of case.[4]

Despite the weaknesses of the MCCU system of performance measurement, it is the system in use by the DOD. How MCCUs are used must be fully understood. Treatment facilities are programmed to perform a certain number of MCCUs per day by their respective higher, major commands. The supply portion of the (approved) Annual Operating Budget (AOB) is tied to the number of MCCUs programmed. The target value for the "cost" of an MCCU at KACH is established by the United States Army Health Services Command (HSC). In 1984 this target value was approximately $18.00 per MCCU per day, and KACH's programmed workload was 351 MCCUs per day. This yields approximately $6318 per day or $2,306,070 ($6318 x 365 days) per year for the supply portion of the KACH 1984 AOB. This $2,306,070 was assigned to the respective departments, branches, sections, and activities using the appropriate UCA account codes.

As in previous years, the 1984 budgets assigned to each work center (UCA account) were not based upon the exact workload being done. They were based, instead, upon historical budgets which were afforded to each account coupled with an intuitive guess of expected workload (projected increase or decrease over the previous year). The supply budgets for departments not directly involved with providing health care (e.g. Logistics; Plans, Operations, Training, and Security; the Comptroller; the Command Group; and others) were factored into that supply cost per MCCU.

A treatment facility's total budget includes the AOB (which supports supply and some other operational expenses) a manpower budget, a major equipment acquisition budget, and a construction

budget. These latter types of budgets are not directly related to MCCUs earned; other mechanisms govern the establishment of their funding levels. Dollars spent on the total budget are charged to each work center and recorded by the UCA. In general, because the MCCU performance measure only relates to a part of the total budget, it falls short of supporting the UCA in matching performance to expense. The UCA tends to be more effective in measuring and accounting for total expense data than total performance data. Occupied bed days, laboratory tests performed, and other workload are measured, but the UCA does not relate the workload directly to MCCUs or episodes of care.

Two subsystems now included in the automated UCA system delve more fully into workload performance and cost measurement for specific components of the health care system. First, the Automated Source Data Collection System (ASDCS) measures the weighted units of production for the Ancilliary Services (Pharmacy, Pathology, and Radiology). A cost per weighted unit is established by dividing total cost (of a particular service) by total weighted units produced (by that service).[5] This system is not directly related to MCCUs but is a valuable management tool in monitoring each of the respective Ancillary Services. This kind of information is quite useful in the model to be developed in this project. Second, the Uniform Chart of Accounts Personnel Utilization System (UCAPERS) is an automated system to help manage manpower resources. It combines Uniform Staffing Methodology (USM) with the UCA. Specific benefits to be gained from UCAPERS are listed below:[6]

UCAPERS BENEFITS

1.- Accurate utilization data, by department, of actual time worked rather than time scheduled.
2. Borrowed and loaned labor report by individual.
3. Overtime/compensatory time report by individual.
4. Maternity leave report by individual.
5. Sixteen types of alphabetic personnel rosters.
6. Automated TDY log.
7. Schedule X data for all work centers.
8. Personnel Utilization Data for USM.

FIGURE 3

UCAPERS will attempt to account for manpower availability, defend staffing requirements, and reflect the general uses of available manhours. Since USM is responsible for establishing and justifying staffing requirements and for recording the hours of manpower involved in specific duty sections, its combination with the UCA should help relate manpower expense to workload performance (hours worked). UCAPERS replaces a manual reporting system for USM. A sample of the form used in the manual system (HSC Form 346-R) is shown at Appendix G. This form has been replaced by direct entry onto menu driven screens of the multiple terminals of an automated data base. The exact mechanics of UCAPERS are available in the appropriate users guides provided under contract by the system vendor to the Office of the Assistant Secretary of Defense (Health Affairs).[7]

Fundamental to fully understanding UCAPERS is a working knowledge of the USM. Once a particular service is defined in the mission statement, the level of staffing and the grade (rank) structure which is required to support that service is determined by the Uniform Staffing Methodology (USM). A reduction in the patient population being served would be expected to reduce the

authorized staffing level, just as an increase in the population being served would be expected to increase the authorized staffing level. An example of the "Schedule X" manpower survey mechanics used in determining the staffing level to be authorized for the Department of Surgery is provided at Appendix H.

HSC surveys MTFs under its control and determines recognized manpower requirements for the entire command to accomplish its health care mission. These recognized requirements are submitted to Congress annually. Since Congress may choose not to authorize the full level of recognized requirements, a lower staffing level (called authorized manpower requirements) becomes the concern for staffing managers. Authorized requirements are those for which funding exists to hire civilian personnel or to assign military personnel.

Staffing levels do not frequently change for two major reasons. First, a hospital's catchment area and size of population served is relatively stable. The second major reason is that changes to the mission list do not often occur. For the purposes of this research effort it will be assumed that the established staffing authorization is relatively constant. The UCA records the expense data for these relatively constant staffing levels and the manpower expense figures used in developing the model to relate the UCA to DRGs will be taken from the quarterly UCA reports.[7]

One specific concept regarding "general uses of manhours" should be addressed. Entries to both UCAPERS and the older manual USM are for the number of hours rendered to specific work centers (e.g. 6 hours to a primary duty section and 2 hours to

military training). Better information to an effective manager would be how many hours are rendered to specific services or what was done during that 8 hours of duty (e.g. 2 hours to cholesystectomy admission number 037345, 1.5 hours to vasectomy admission number 037312, 1.25 hours to unit level physical fitness training, 2.25 hours to 6 outpatient clinic visits, and one hour to Continuing Medical Education). From this more specific data, many valuable statistics regarding cost/performance relationships could eventually be generated. Examples of reports which could be provided are average time per cholesystectomy, percent of available time dedicated to physical fitness training, and average time per clinic visit. This kind of data would be difficult to gather under manual methods. With automation, however, the gathering and manipulating of this data would be an attainable objective.

THE 23 MAJOR DISEASE CATEGORIES

The World Health Organization has attempted to facilitate the identification of the reasons for which a person might be admitted to the hospital by creating a catalog of diagnoses. The title of this three volume catalog is the International Categorization of Diseases Adapted for US Hospital Use (ICDA). The Army uses the 9th Edition of the ICDA (ICDA-9). Most civilian hospitals in the United States have transitioned from ICDA-9 to a modified edition for Clinical Methodology (ICDA-9-CM) because of its ability to capture more of the ambulatory

workload. There are thousands of diagnoses with corresponding 5 digit number codes in the ICDA-9 and ICDA-9-CM.

As mentioned in the literature review, the Yale University study established 23 MDCs which include the 470 DRGs.[8] Certainly 23 categories were less cumbersome for categorizing the thousands of diagnoses which were already established by the ICDA index. In general, each MDC was constructed to correspond to a major organ system (e.g. Respiratory System, Circulatory System, Hepatobialary System). A complete listing of the MDCs is at Appendix I. Each MDC was evaluated to identify those additional patient characteristics which were expected to have a consistent effect on the consumption of hospital resources. From this evaluation, Diagnosis Related Groups (DRGs) were identified within each MDC. As the name implies each DRG was a group of diagnoses which were similar.

Under this system all inpatient health care can be divided into the 23 MDCs. Each MDC can then be divided into a set of particular DRGs. Each of the 470 DRGs is comprised of numerous, specific diagnostic codes indicated by the ICDA and CPHA systems. An alternative to budgeting in accordance with the organzation structure at Appendix F would be to budget in accordance with the MDCs being supported by the hospital. The advantage to funding based upon an MDC model would be that funding could be applied directly against work being performed and not departments performing the work. A model of this concept is shown at Figure 4.

AGGREGATION OF CARE COSTS INTO DRG'S AND MDC'S

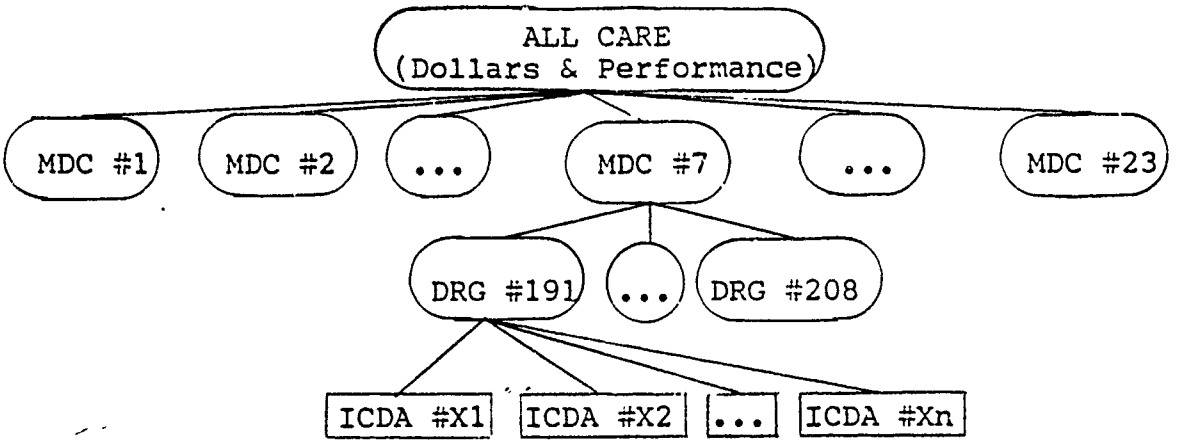

FIGURE 4

A list of all 470 DRGs complete with average length of stay, weighted values, and prices set by a nearby community hospital is at Appendix J.

This paper will focus on MDC #7, Diseases of the Hepatobialary System. There are 18 DRGs in this category. The specific DRGs of MDC #7 are highlighted at Annex 1 to Appendix J. Also shown are the frequencies that KACH performed each of these DRGs in 1984. MDC #7 was selected because KACH had performed roughly 100 of these cases in Calendar Year 1984. One hundred cases was about the maximum number of cases that a single researcher could evaluate. Also, MDC #7 tends to be comprised of more surgical procedures than medical cases. Quantifying hours required for surgical procedures is a simpler task than attempting to quantify the time required for purely medical procedures. This made possible the selection of the Department of Surgery as the principal department for the study.

Identification of the cases belonging to MDC #7 was done by the HCSCIA. Inpatient cases performed at KACH in CY 84 reported under ICDA-9 codes were in an automated data base. ICDA-9 codes cannot be "grouped" into DRGs. KACH's ICDA-9 codes were translated to ICDA-9-CM codes by HCSCIA. ICDA-9-CM codes were then processed through a "Grouper" program to distribute them to the appropriate DRGs. ICDA-9 codes must be translated because the CM version is the program upon which DRGs are based. ICDA-9-CM is considered more desirable than ICDA-9 because medical records technicians can also code clinical or ambulatory workload. Of 3756 records processed all but 35 were effectively assigned to a DRG. Of the DRGs in MDC #7 (#191 to #208), there were 94 cases from KACH's CY84 workload. The report from HCSCIA is at Appendix K.

THE MODEL

Specific inpatient case numbers identified by HCSCIA were referenced against the KACH inpatient admission register. A roster was then set up containing the information illustrated at Figure 5 below.

ROSTER

NAME	Register #	DRG #	SVC	FMP	SSN	LOS	REMARKS
2. XXXX	0320126	192	AA	30	586-01-5186	6	A2,79
3. YYYY	0320897	194	BA	30	223-60-7293	10	
4. ZZZZ	0320221	197	BA	02	251-64-3520	22	
...	...	...	..	..	.....	..	

FIGURE 5

The complete roster is at Appendix L. The roster of names and register numbers was used to obtain the medical (inpatient) records. (Names of patients were, in fact, deleted from Appendix L in order to protect the privacy of the individuals involved.) Register # refers to the inpatient admission numbers assigned to individuals at the time they enter the hospital. This number is subsequently used in medical statistical reporting. DRG # refers to the DRG to which each inpatient diagnosis belongs (#191-#208). At Appendix M is a pairing of the ICDA-9 codes to the appropriate DRGs. SVC refers to the hospital service to which the patient is assigned during the treatment regimen (AA = Medical Service, BA = Surgical Service, CA = Gynecology Service, and FA = Psychiatry Service). The first two digits of the four digit UCA codes align it with the inpatient service which it supports. FMP refers to Family Member Prefix (20 = active duty service member, 30 = spouse of active duty service member, 01 = 1st child, 02 = 2nd child, and so forth). SSN stands for the patient's social security number. LOS is the acronym for length of stay. The remarks column is used to identify the multiple admissions in 1984. (The person at roster number 2, for example, is also roster number 79.) At Annex 1 to Appendix L is a calculation showing the average length of stay for the cases in the study. For the cases of MDC #7 which are being analyzed the average length of stay was 10.9 days with a standard deviaton of 10.99. Clearly there is no strong central tendency for the LOS for MDC #7 when considered collectively. Appendix M portrays the pairing of the ICDA-9 codes to the appropriate DRGs.

From the quarterly UCA reports, cost and performance data were extracted for the hospital services which supported MDC #7. A complete listing by quarter is at Appendix N. An overview of the annual data is shown at Figure 6 below.

ANNUAL HOSPITAL SERVICE COST/PERFORMANCE DATA

Service	Total Expense ($)	Total Performance (Occupied Bed Days)	Average ($/OBD)
AA - Medical	3797914	15517	244.76
BA - Surgical	1912896	5997	318.98
CA - Gynecology	863741	2271	380.34
FA - Psychiatry	312827	1207	259.18
Total	6887378	24992	275.58

FIGURE 6

Average cost per Occupied Bed Day (OBD) was obtained by dividing total expense by total OBD. The figure $275.58 represents all expenses (e.g. the utility bill, linen service, clinician fee, ancillary support, administrative and logistical support, and all other services) involved with the average inpatient occupied bed day. The mechanism which permits the consolidation of direct and indirect costs to final operating expense accounts was mentioned earlier in the discussion of the UCA; it is the "Stepdown Assignment Statistic" (SAS). Expenses are distributed in a designated hierarchial order in accordance with the rules provided at Appendix O. This distribution at KACH resulted in the 1984 service specific total costs indicated at Figure 6.

Multiplying the LOS for each of the 94 cases by the average cost/day of its associated service (AA, BA, CA, or FA) yields an estimate of the cost of each case. An example is shown below.

COST ESTIMATE PER DRG FROM UCA COST/PERFORMANCE DATA (UNADJUSTED)

Case #	SVC	LOS		Average Cost/OBD		Case Cost
2	AA(Medical)	6	times	$ 244.76	=	$1468.56

FIGURE 7

The cost of each DRG in MDC #7 which KACH treated in 1984 is calculated at Appendix P. Also at this Appendix KACH's estimated costs per case are compared to the DRG reimbursement values of a local community hospital. Row numbers of Appendix P relate to the row numbers on the roster at Appendix L. Column I is the average cost of an inpatient bed day, by service, at KACH. Column J is a nearby community hospital's DRG reimbursement rate. Column K is the DRG rate minus the estimated KACH cost. Negative numbers indicate that KACH was more expensive than the civilian hospital. Row 96 of Appendix P has the total costs. KACH MDC #7 cases of 1984 were $278,056.94. The DRG reimbursement for those cases would have been $282,794.38. The difference in total cost between the DRG rate and the estimated KACH cost was $4737.44. From this chart it is apparent that KACH was estimated to be $4737.44 or 1.7% cheaper than DRG reimbursement would have been for the same 94 inpatient cases. It should not be overlooked, however, that on some specific cases KACH is more expensive. Money is lost because patients are kept for what would appear to be an excessively long LOS. One additional point is that DRG rates do not include provider fees (doctor, anesthesiologist, and so forth) so the cost savings in having those cases done by KACH is actually even more than the dollar value shown.

Appendix P is a rather rough cost per case estimate. Average costs per OBD might not be representative of specific

cases. A better model is necessary to be able to truly defend the assertion that the costs of KACH cases can be determined or even that they are or are not cheaper than DRG rates. Recall that the average bed day cost includes all direct and indirect costs of cases treated. By extracting the expense data of larger, more expensive, contributors of care from the average cost per bed day, it is possible to reduce the degree of error attributed to case averaging. Subsequently, by adding back the exact expense of these larger contributors of care, a truer cost for each case can be established. The departments identified in this study as "larger contributors" were: ancillary service support, nursing care support, operating room support, recovery room support, and anesthesiology support. Total operating costs incurred by each of the larger contributors in the performance of their mission were obtained from quarterly UCA reports, and this extraction was done. The fractions of cost for each of the "larger contributors" were identified and subtracted from the total cost of the respective services (AA, BA, CA, and FA). This is illustrated in Figure 8. A complete table of the itemized costs is shown at Appendix Q. The machinations which produced these itemized costs are shown at Annexes Q1-Q7 to Appendix Q.

Expenses were aggregated by all UCA codes belonging to the given services. In nursing, for example, AAHA is the code for the medical intensive care ward, AAXA is the code for medical patients on ward B2, ABCA is the code for surgical intensive care patients, and so on. From the adjusted or purged data regarding OBD costs at Appendix Q, it is possible to start redefining the

FRACTIONALIZATION OF LARGER CONTRIBUTORS

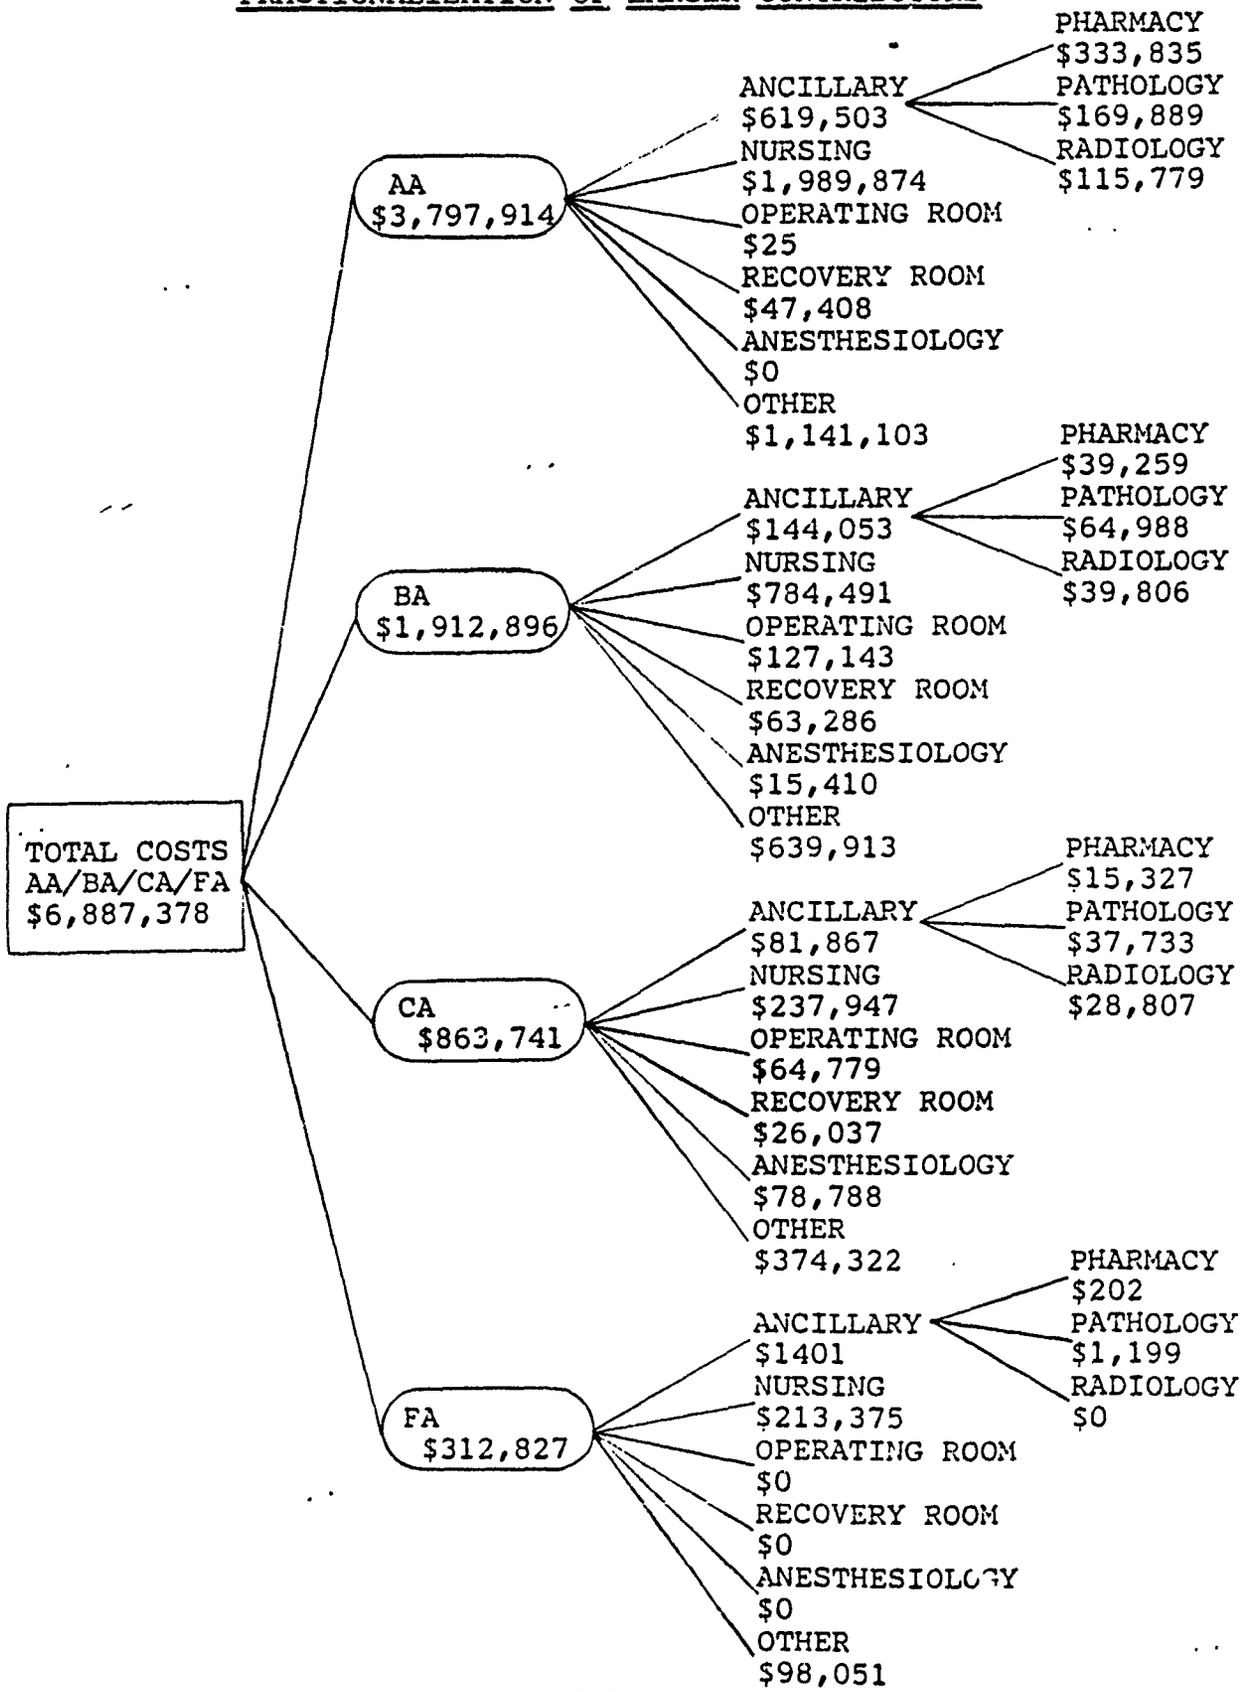

FIGURE 8

cost per DRG. The adjusted cost per service per OBD includes the clinician's cost, a share of the linen service's cost, a share of the utility cost, a share of base operations costs, and the other costs recorded in the remainder of the 206 UCA codes employed at KACH other than those itemized as "larger contributors". Though all 206 UCA codes could have been itemized, it is beyond the scope of this paper to do so. Multiplying the LOS for each case by the adjusted cost per OBD figure (for the applicable service (e.g. AA, BA, CA, and FA)) yields a general expense figure for placing and keeping the individual in the hospital. This is done at Appendix R.

The next step is to determine the expense of each patient's care by each of the "larger contributors" and to add that expense to the base line or general expense category. This process is shown in Figure 9.

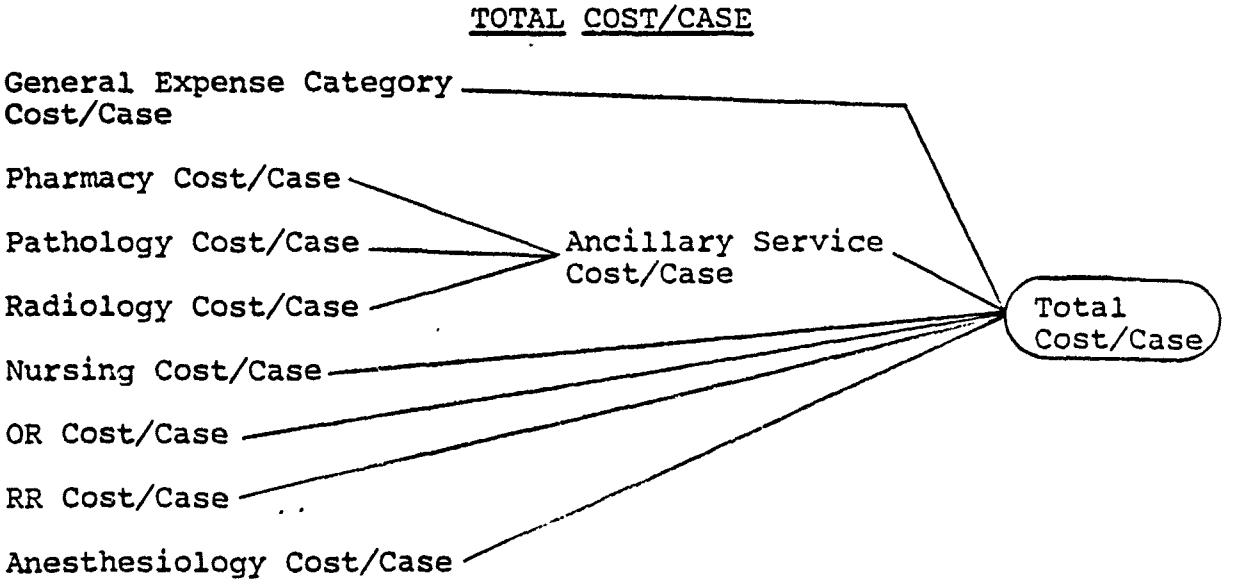

FIGURE 9

In the Ancillary Services, workload is measured and recorded by the ASDCS in weighted units. The reason for "weighted" values is that some tasks are more resource intensive than others. The more resource intensive, the higher the weighted value assigned to that task. Total weighted units produced by each of the Ancillary Services was divided into the total expense for that service to yield an average cost per weighted unit. The annual average for each of the Ancillary Services is provided in the matrix below.

ANNUAL VALUES FOR ANCILLARY SERVICE COSTS PER WEIGHTED UNIT

SERVICE	EXPENSE ($)	WORKLOAD (WTD UNITS)	AVERAGE COST ($/WTD UNIT)
PHARMACY	2,213,679	341,050	6.49
PATHOLOGY	1,952,821	1,744,764	1.12
RADIOLOGY	1,598,037	116,382	13.73

FIGURE 10

More detailed information is at Appendix S. By reviewing inpatient medical records and surveying them, it is possible to determine the exact amount of support (workload) provided by each of the respective ancillary services. This is done by counting each type of service provided to determine its frequency and by multiplying that frequency by the appropriate weighted value for that type of service. By multiplying the case's total weighted unit workload by the average cost per weighted unit, the expense of that case can be determined. In each record, for example, the number of unit doses and sterile products provided by the Pharmacy can be determined. Multiplying the quantity of unit doses or sterile products by their weighted values and then multiplying the total weighted units by the average cc t per

weighted unit yields the Pharmacy's expense of supporting each case. A sample worksheet which was used in surveying each medical record to count frequencies of pharmacy weighted units is at Annex 1 to Appendix S. A similar methodology was employed to determine the pathology and radiology costs of support provided to each case. Sample worksheets are at Annexes S-2 and S-3 respecively. The tabulated ancillary service costs for the cases in the study are shown at Annexes S-4, S-5, and S-6.

One concern in surveying medical records to determine the total number and type of services performed is that there is no way to account for repeat tests. For example, if a laboratory test result is questionable, it is repeated for verification. In the medical record, however, there is only a record of one test. The laboratory does count the workload, but it is not "charged" to the case; it is charged to the service supporting the case (Medical, Surgical, and the like).

The costs for nursing support to inpatients of KACH in CY 84 were extracted from Quarterly UCA reports and are shown at Appendix T. Nursing care hours supporting each case were determined by use of an acuity of care model. The acuity of care model is used by nursing managers to determine the number of direct care hours required by each inpatient each day. More seriously ill patients require a greater number of direct care hours. There are 6 categories and the number of nursing care hours for each is as follows:

9

HOURS PER DAY OF DIRECT NURSING CARE PER ACUITY CATEGORY

Category I - 2 Hours	Category IV - 18 Hours
Category II - 5 Hours	Category V - 27 Hours
Category III - 11 Hours	Category VI - 45 Hours

FIGURE 11

A sample worksheet used for tallying a patient's category each day is shown at Annex 1 to Appendix T. Points are earned for treatment and frequencies of treatment rendered to each patient. At certain thresholds the point values raise a patient's category to a higher acuity level or patient category. The total direct care hours rendered to each patient, in accordance with the acuity model, is at Annex 2 to Appendix T. In addition to the number of hours an estimated cost for those hours is also shown. The cost for an hour of nursing care was approximated from the average cost per man hour at KACH. An average manhour cost was used because of the wide variance found in the pay grades of the Nursing staff. KACH's average full time equivalent (FTE) employee manyear is $24,500. There are about 2088 hours in an FTE. Dividing cost by hours ($24,500/2088) yields about $11.73 per hour. The nursing care cost for each case in the study was obtained by multiplying the number of direct nursing care hours per case by $11.73.

Operating Room (OR), Recovery Room (RR), and Anesthesiology hours are determined from the OR and RR log sheets. Anesthesiology hours were assumed to be approximately equal to the OR hours. The fraction of hours used for a given case divided by the total of all available hours when multiplied by the total expense figure for each service yields the cost per

case. All three of these services are shown at Appendix U.

Adding the "larger contributor" specific component costs to the base line or general costs shown at Appendix R provides a more defensible figure for the cost of each case in the study. The formula for the cost of a Diagnosis proposed in the introduction can now be used:

a(DxA) = aa'U1 + aa''U2 + aa'U3 + ...aa'Un

Where a = the # of cases of DxA treated
DxA = the average cost of treating Diagnosis A
a' = the proportion of the indicated UCA Codes supporting DxA.
U1 = UCA Code for Department 1
U2 = UCA Code for Department 2
U3 = UCA Code for Department 3
Un = UCA Code for Department n
Where n is the aggregation of all other supporting departments.

These refined DRG costs are at Appendix V. At Annex 1 to Appendix V is the comparison of the revised KACH expenses, by case, to the DRG reimbursement values.

Average costs per DRG are calculated at Appendix W. Inserting these average DRG costs for MDC #7, the formula for the cost of MDC #7 that was proposed in the introduction can now be employed.

Resources for MDC #7 = a(DxA) + b(DxB)+c(DxC) + ...n(DxN) + OAC

Where a = the # of cases of DxA treated
DxA = the average cost of treating Diagnosis A
b = the # of cases of DxB treated
DxB = the average cost of treating Diagnosis B
c = the # of cases of DxC treated
DxC = the average cost of treating Diagnosis C
n = the # of cases of DxN treated
DxN = the average cost of treating Diagnosis N
(The last of the diagnoses included in the 18 DRGs under MDC #7.)

OAC = Other acceptable costs (i.e. PT, Unit Training, Committee Meetings, and Admin/Log Functions). The OAC will be expressed as a percentage of productive Dx costs (i.e. .25(a(DxA) + b(DxB)+c(DxC) + ...n(DxN))

Three major gaps exist in the information provided by this study. First, not all 18 DRGs were treated at KACH in 1984, and, therefore, specific DRGs in the formula have a zero value for cost. Until these cases are done and costs are determined, this study has failed to provide completed data regarding the expected costs of MDC #7. Second, if the study were continued and the data base expanded, the average cost per DRG would be expected to be more representative of the true expected costs for treating DRGs and have a smaller standard deviation. A 95% confidence interval (2 standard deviations) for average DRG costs (See Apendix W) in this study cannot be considered useful because of the broad distribution. Finally, the OAC requires further research to be justly established. In this study, the OAC or "profit" earned from DRGs treated was $36,128.46 less than the set DRG rates in the local area (282,794.38). Expressed as a percentage figure these savings represent 12.77% (36,128.46/282,794.38 x 100). Recall that provider (Dr) fees are not included in the DRG rate but are in the KACH rate. The 12.77% is a conservative estimate. Though KACH provider expenses were not itemized in the study, Anesthesiology expenses were. Subtracting Anesthesiology expenses of $17,045.89 leaves a KACH total expense of $229,620.03. A "profit" of $53,174.35 or 18.80% (53174.35 / 282,794.38) can be claimed when compared with DRG

rates of reimbursement. The concept of using an OAC variable could/should help manage nonproductive levels of activity by providing some objective goal or "target" to work toward not exceeding. Based upon this study the OAC sould · t be greater than 18.80% of the "productive" workload.

III. CONCLUSIONS AND RECOMMENDATIONS

The most striking observation in this study was that in cases where the KACH lengths of stay were close to the expected or average length of stay established for DRGs the cost efficiency for each case treated was optimized. KACH's costs were as little as 15% of the DRG reimbursement rate. It follows that if KACH were to perform Utilization Review based upon DRG ALOS and attempted to discharge patients within the DRG ALOS, health care costs could be reduced. Also observed was the phenomenon that KACH was generally less expensive than the established national average DRG rates of reimbursement. This amount was 12.77% in terms of tangible dollar savings plus intangible savings which are more difficult to measure. This is an ample argument for continuing military health care at the current or even expanded levels.

A second major observation is that the MCCU system encourages inefficiency. A hospital is rewarded for what it does. It is not rewarded for minimizing or economizing required services at the lowest possible level which affords quality health care. Use of the term quality implies a level of care which is adequate but limited to only what is necessary. A DRG based budgeting system would encourage efficiency, especially if hospitals could use the "profits" earned by economizing health care costs in accordance with their own priorities. Since the term profit is alien to military MTFs, it is used here to represent the difference or profit margin between what is budgeted to treat a DRG and what it actually costs. It is

obvious that a positive difference would be the objective. A hospital's priorities for these profits might include but are not limited to: the OAC functions mentioned in the model or new medical or automation equipment.

The difficulty in identification of DRGs treated would be eliminated if military treatment facilities were to adopt ICDA-9-CM (a departure from ICDA-9) as their catalog for coding of diagnoses treated. It would be recommended that this be done, except that during this study the Researcher learned that the DOD is planning to make the transition to ICDA-9-CM in January 1986. This study supports that decision.

Finally, the fact that all accounting (under the UCA) of cost and performance data are now being done by departments and not by cases, makes the task of determining case costs and the case mix of care provided by military hospitals very difficult. If another cell was added to the menus of Pharmacy, Pathology, Radiology, and UCAPERS systems for the inclusion of an inpatient register number, the cost of each case/procedure/hour of support could be effectively captured and reported by the existing automated equipment. Such a reporting system - the costs of cases treated - would afford the ability to better monitor productivity and cost. Assuming that hospital leadership will require aggressive management, this better information should result in improved efficiency of military medical treatment facilities due to better management of those facilities. It is strongly recommended that such a cell be added to the menus provided by the software of the current automated UCA equipment

upon which work performance is reported. Including the case numbers on work or performance reports would afford the ability to obtain case specific cost/performance information from manipulations of the automated data base in the future. In both military and civilian health care arenas, the ability to accurately monitor and manage the cost of cases to be treated appears to be a situation upon which the accomplishment of the mission will depend. Perhaps economical survival itself will hinge upon how well managers control the costs of cases to be treated.

Appendix A

DEFINITIONS

AA - UCA Prefix for Inpatients belonging to the Medical Service.

ALOS - Average Length of Stay (for a given DRG or diagnosis).

AMEDD - The Army Medical Department

Ancillary Services - Term used by the UCA for Pharmacy, Pathology, and Radiology Services.

ASDCS - Automated Source Data Collection System (A component of the Uniform Chart of Accounts)

ASDM - Automated Source Data Management subsystem of the Uniform Chart of Accounts. This system correlates workload and expense data input by the local medical treatment facility.

BA - UCA Prefix for Inpatients belonging to the Surgical Service.

CA - UCA Prefix for Inpatients belonging to the Gynecology Service.

CAP - College of American Pathologists (Professional organization of pathologists from which the weighted values for lab procedures are generated).

CPHA - Commission on Professional and Hospital Activities, a professional organization providing the inpatient classification system currently in use throughout the United States.

DOD - The Department of Defense

DRG's - Diagnosis Related Groups (There are 467 DRG's into which all inpatient diagnoses are grouped.)

EASPP - Expense Assignment System Preprocessor (a component system of the UCA used for expense assignment and reporting).

EOE - Elements of Expense (Travel, Supplies, Equipment, Manpower, and so forth).

FA - UCA Prefix for Inpatients belonging to the Psychology Service.

GNP - Gross National Product

HCSCIA - The Health Care Studies Clinical Investigation Activity of Health Services Command.

HSC - Health Services Command of the U S Army

ICDA-9 - International Categorization of Diseases Adapted for Use in American Hospitals, 9th Edition; the catalogue for classification of disease, injury, and illness currently in use in military hospitals.

ICDA-9-CM - A revision of ICDA-9 which includes Clinical Methodology (more ambulatory care type cases) which civilian hospitals throughout the US have adopted and which military hospitals will adopt in January 1986.

IPDS - Inpatient Data System (Data Base in use at PASBA)

KACH - Kenner Army Community Hospital, Fort Lee, Virginia

LOS - Length of Stay (for a particular admission).

MCCU - Medical Care Composite Unit, a ficticious unit of measure of hospital productivity. 10 MCCU's are "earned" for each admission, 1 for each occupied bed day, and .3 for each outpatient clinic visit.

MDC - Major Disease Category (There are 23 MDC's which roughly correlate to the major systems (circulatory, respiratory, and so on). All DRG's are assigned to one of these MDC's.)

OAC - The variable name for Other Acceptable Costs which was generated in the model provided for this study. It includes but is not limited to TDY, Committee Meetings, Physical Training, Military Training, and Field Training.

OBD - Occupied Bed Day

OR - Operating Room

PASBA - Patient Administration System and Biostatistics Activity of Health Services Command

RR - Recovery Room

SAS - Stepdown Assignment Statistic, a technique for assigning indirect costs of a medical treatment facility to the departments and activities which provide direct care. This technique zero's the cost centers which are not involved in direct patient care.

UCA - Uniform Chart of Accounts (A military health facility accounting system for performance and expense data)

UCAPERS - The Uniform Chart of Accounts Personnel Utilization System automated component which combines UCA and USM data to provide meaningful manpower expense and performance information.

USM - Uniform Staffing Methodology or a technique of establishing manpower requirements to accomplish required tasks.

EKG Technician (Y6)		X	

HSOP-FF (23 Oct 84) 3d Ind
SUBJECT: Mission Assignment List

HQ, US Army Health Services Command, Fort Sam Houston, Texas 78234-6000 28 NOV 1984

TO: Commander, US Army MEDDAC, ATTN: HSXO-C, Fort Lee, Virginia 23801-5260

1. Your Mission Assignment List has been reviewed and the following changes were made:

a. Physiatry - Not authorized

b. Residential Treatment Facility - Not authorized

c. Clinical Investigation Service - Not authorized

d. Medical Corps Residency/Fellowship - Not authorized

2. The approved Mission Assignment List is attached at Inclosure 1. If a change in status of mission function is desired, documentation will be in accordance with HSC Regulation 10-1, paragraph 1-3.

FOR THE COMMANDER:

Blue Cross Blue Shield of Virginia

PPS RATE CALCULATION WORKSHEET

JOHN RANDOLPH HOSPITAL

Facts:

. Fiscal Year End December 31, 1984

. Urban X Rural _____

Federal Portion:

Labor Related Component (330 FR)	$	2,183.42
Wage Index (39875 FR)	x	.8866
Sub-Total, Labor Component	$	1,935.82
Non-Labor Component (330 FR)		581.98
Total Federal Portion	$	2,517.80

Hospital-Specific Portion:

Base Period Cost per Discharge per HCFA-1007, Part VII , line 14	$	
Updating Factor (329 FR)	x	1.12333
Case-mix Index (39868 FR)	÷	.9501
Total Hospital-Specific Portion	$	XXXX

Blended Rate:

Hospital Specific Portion $(approx) 2738.19 x 75% = $(approx) 2053.65

Federal Portion $ 2,517.80 x 25% = 629.45

Total Blended Rate on which payments will be based for discharges on and after October 1, 1983 $ 2683.10

Note: "FR" references are to specific pages in the September 1, 1983 and January 3, 1984 Federal Registers

SECTION D - SPECIFIC REMARKS

COMMANDER

The General Surgical Clinic is conducted Monday through Friday from 0800-1200 and 1300-1700. Urology Clinic is conducted Monday, 0800-1200 and 1300-1700; Wednesday, 0800-1200 hours.

The duties of the Clinic NCOIC include suture removal and evaluation, debridement of minor wounds, including burns, irrigations, and assisting with incisions and drainage of wounds, proctoscopic examinations, vasectomies, catherizations, perform and assist minor surgical procedures, applications of occlusive dressings and Unna boots. At all times, the clinic must be maintained with adequate supplies while budgeting, forecasting, and anticipating future needs. An inventory and stocking of equipment is maintained. The meticulous cleanliness of surgical treatment rooms for control of infection and maintenance of equipment is performed. The coordination of patients and assisting in providing smooth continuity in patient care is a key function of the NCOIC. This includes patient direction, lab slips, X-rays, consultations, interpretation of instructions and other orders to aid the general surgeons in smoothly and efficiently seeing large numbers of patients.

The Department of Surgery's secretary is already overburdened with administrative paperwork, correspondence, scheduling and coordinating with patient problems both in general surgery and urology as well as the many studies which are not available at Kenner Army Community Hospital (i.e., gastroscopy, colonscopy, etc.). Considerable time is necessitated in coordinating the operating room schedule and use of CHAMPUS forms, transfers of gynecologic patients to supporting hospitals, monthly reports, typing, filing, and a myriad of other duties for the Surgical Department. The secretary of the Department of Surgery performs duties for 3 General Surgeons, 2 Orthpedic Surgeons, and 2 Urologists. The Department Secretary is a key link in overseeing the military channels and regulations in guiding the surgeons to provide medical care within the scope and guidelines of the military. Clerical support is recognized under Clinical Support Division.

The following is a complete and accurate breakdown of all procedures performed in and through the General Surgery Service:

Operating Room procedures are done on Tuesday, Wednesday and Friday in the AM only except in an emergency. A monthly breakdown and averages for the survey period are as follows:

DATE	# OF OR PROCEDURES
FEB 83	26
MAR	31
APR	30

SCHEDULE X (S 2, L 2) - Continuation Sheet

SEC D. SPECIFIC REMARKS (Cont)

COMMANDER

Due to the amount of office space available it has been necessary to house the Dermatology Clinic with the Surgical Clinic. The surgical clinic nursing staff also assists in patient care in the dermatology clinic. This has been partially supplemented by the use of one Practical Nurse from the Department of Medicine .

The following is a breakdown of all procedures performed in the Dermatology Clinic:

DATE	MINOR SURGERY	PATCH TESTS
FEB	61	2
MAR	62	6
APR	70	8
MAY	99	5
JUN	131	6
JUL	37	4
AUG	11	2

Average	666	598	68

The Yardstick Codes do not address the fact that the physicians perform major and minor surgical procedures. Request local appraisal be considered.

The General Surgery Service has the responsibility for ordering ostomy supplies and providing inpatient and outpatient education.

Clerical support is requested on Sheet No. 4, Line No. 12.

RECOMMENDED STAFFING:

1	OFF	(MC)	General Surgeon (Chief of Dept)
3	OFF	(MC)	General Surgeon
1	OFF	(MC)	Anesthesiologist

11		

MANPOWER SURVEY REPORT - REMARKS For use of this form, see AR 570-4; the proponent agency is Office of the Assistant Chief of Staff for Force Development.	1. SHEET NO. 2	2. LINE NO. 2	REPORTS CONTROL SYMBOL CSFOR-76

3. CHECK APPLICABLE BLOCK. ☐ SURVEY TEAM GENERAL REMARKS (complete item 4, only, and file after Commander's General Remarks.)

☐ COMMANDER GENERAL REMARKS (complete item 4, only, and file after Coversheet, DA Form 140.)

☒ SURVEY TEAM SPECIFIC REMARKS (If this block is checked, complete items 1, 2, and 4 and file with Schedule X.)

4. REMARKS: (If more space is required, continue on plain paper 10½" x 8".)

a. The functions indicated on this schedule were reviewed and found to be as stated.

b. The information in Section B was reviewed, found to be valid, but was not considered in determining manpower requirements because updating of the current workload through April 1984 indicated an average of 669 clinic visits per month.

c. Yardstick Codes 557-31/557-32/557-52.21 were applicable to this activity and were used in conjunction with local appraisal.

(1) Yardstick Code 557-31: 2 + .13 (10-4) = 2.78 or 3 requirements.
Work Unit: Medical Officers (10)

(2) Yardstick Code 557-32: 1 - .033 (30-9) = 0.307 Physician Requirement.
Work Unit: Occupied Beds (9)

(3) Yardstick Code 557-52.21: 669 Clinic Visits ÷ 450 = 1.49 Physician Requirements.
Work Unit: Clinic Visits (669)

(4) Local Appraisal: Plus 0.48 requirement.
Rationale: 0.48 physician requirement was recognized to provide for the performance of in-clinic procedures in the surgical clinic. On-site verification established that 293 procedures were performed per month and that the average time per procedure was 15 minutes.

293 Procedures X 15 minutes ÷ 60 ÷ 168 X 1.11 = 0.48 Physician Requirement.

(5) Local Appraisal: Plus 1 requirement.
Rationale: One Urologist requirement was recognized to provide for the mission needs of Kenner Army Community Hospital.

(6) Yardstick Code 557-32: Direct Reading = 1 Anesthesiologist.
Work Unit: Episodes of Surgery (80) IAW note to Y/S one Anesthesiologist was recognized to provide for the performance of 80 episodes of surgery per month. This requirement is also validated based on the mission needs of the MEDDAC.

FOR EXAMPLES AND INSTRUCTIONS, SEE APPENDIX B, DA PAMPHLET 570-4.

DA FORM 1 DEC 73 140-1

PREVIOUS EDITIONS OF THIS FORM ARE OBSOLETE.

* U.S. GPO: 1974—540-842/8623

Manpower Survey Report Sheet 2 Line 2

Survey Team Remarks (continued)

(7) Physician Recap:

Y/S 557-31 =	1.00 Requirement
Y/S 557-32	1.307 Requirement
Y/S 557-52.21	1.49 Requirement
Local Appraisal	1.48 Requirement
	5.24 or 5 Requirements

(8) Local Appraisal: Plus 1 Requirement.
Rationale: One requirement was recognized to provide para-professional support for the in-clinic procedures performed in the Surgical Clinic. On-site validation indicated 293 procedures per month which required 25 minutes per procedure.

293 procedures X 25 minutes ÷ 60 ÷ 168 X 1.11 = 0.81 or 1 Requirement.

(9) Local Appraisal: Minus 2 Requirements.
Rationale:

(a) The requirement for a PSNCO from Y/S 557-31 was not recognized because the Surgical Service is not organized in a manner which requires an NCO. The support is provided by Clinical Support Division as needed.

(b) One clerk-typist position recognized on Y/S 557-52.21 was addressed on sheet 4, line 12 Ambulatory Care Support Branch.

(10) Total Yield: 10 Requirements.

d. The commander's remarks, Section D, were found to be essentially as stated.

e. The survey team nonconcurred with the commander and recommended staffing as indicated below:

3	Off (MC)	General Surgeon
1	Off (MC)	Urologist
1	Off (MC)	Anesthesiologist
2	Enl	Dispensary Specialist
2	Civ	LPN/NA
1	Civ	Secretary
10	Total	

APPENDIX I

MAJOR DISEASE CATEGORIES

MDC 1: Disease and Disorders of the Nervous System

MEMORANDUM FOR CPT Cornell

SUBJECT: Selected IPDS/DRG Data for Ft. Lee for FY 84

1. We have prepared the attached data for your facility using a recoded and reconfigured IPDS data base.

2. Enclosure one is the output from the Health Systems International Grouper program. This set of tables displays the frequency by DRG, MDC and return code (RTC) produced by the DRG GROUPER program. Enclosure five is a listing of the data element definitions for the fields used by GROUPER program. Your recoded IPDS data have been grouped using release 2 of the ICD-9-CM GROUPER which became effective as the official version for DRG assignment on 1 June 1983.

3. Enclosure two, the Case Mix Summary data for your MTF, contains a variety of summary/descriptive data to help make the DRG data meaningful and introduce the concept of case mix measures. The following definitions may be helpful in explaining this new concept. Case mix is defined as the relative proportion of cases that fall into mutually exclusive case types (e.g. DRGs). Case mix measures are calculated by application of a set of weights to the number of patients falling into each case type within a hospital. Each case type (e.g. DRG) receives a distinct weight, constant for all hospitals, that represents the relative hospital resource utilization of an average or ideal case that falls into that case type. These case mix measures employ a specific set of ative weights. In this case the weights employed were those published by th Care Financing Administration (HCFA). The products of the number of s in each DRG times the relative weight (relative weight products) are resulting total is then divided by the total patient dispositions, the case mix index.

The dimension of complexity that is estimated in any given case mix measure is determined by the set of weights used to estimate the relative expected patient resource consumption. Without validation of the HCFA weights for AMEDD data, they should be considered preliminary and subject to revision. Case mix indexes are a special type of case mix measure that employ a base case mix for comparison purposes. Since we have used HCFA weights for this purpose, it is important to understand what the case mix index figure represents in relative terms. When the hospital under study has a more complex, i.e., more costly or more resource intensive, case mix than the base case mix, the calculated case mix index will be greater than 1.00. A hospital whose case mix is less complex than the base case mix will have a calculated case mix index of less than 1.00. A case mix index, then, results in a standard of 1.00 against which any given hospital's case mix complexity may be assessed. Thus a case mix value of 1.1 indicates an estimated 10 percent more complex mix of patients. Because of the AMEDD requirement to treat a relatively healthy population as first priority coupled with the inherent "domiciliary" responsibilities that accompany management of our younger enlisted soldiers, most AMEDD MTF case mix indexes appear to be lower than the

expected base case mix of 1.00, reportedly the average case mix for civilian hospitals treating Medicare patients.

There are two case mix index figures provided in this section of the report, the unadjusted and the adjusted. The adjusted case mix is the more valuable of the two indexes in that patient records assigned to DRGs 469 and 470 have been eliminated. The titles for DRGs 469 and 470 are; " Primary diagnosis invalid as a discharge diagnosis" and "Ungroupable", respectively. These were eliminated because the relative weight value for each is 0.0. Civilian hospitals with data in those specific DRGs would review the records in order to have them reassigned to more definitive DRGs. Therefore, we have computed the adjusted case mix without using the records assigned to DRGs 469 or 470.

The number of non-empty DRG cells (adjusted) is a descriptive statistic that shows the number of different groups or data cells used to classify your MTF's data. The maximum number of DRG cells available in the DRG schema is 470, as described in section II above.

The total count adjusted for DRG cells 469 and 470 reveals the number of Individual Patient Data System dispositions assigned to DRGs 1-468. This count states the number of records included in the calculation of the "adjusted" case mix index.

The next portion of case mix summary table describes the MTF workload in terms of relative weight quartiles by reporting the count and percent of workload developed by quartile. The table displays the HCFA established relative weights sorted and arranged by quartiles with the 1st quartile reflecting the DRGs with the lowest relative weight value through DRGs with a relative weight value of 0.6291. The column titled relative weight ranges delineates the range of weights included in each quartile. The term "LT" means less than while "GT" means greater than. The next column in this module is entitled count and displays the number of patients assigned to DRGs that fell within the aforementioned relative weight range. The percent workload column reveals the overall percent of patients assigned to the respective quartiles. This may be used to explain the high or low value of the case mix index by displaying the concentration of dispositions in DRGs with low or high value relative weights. As an example, if 60 percent of a hospitals' data fell into the first quartile, it would seem reasonable to expect a fairly low case mix index which may be further interpreted to mean a relatively low case complexity and low cost per patient. Conversely, a higher case mix index would result if the MTF had a relatively even distribution of data across each of the relative weight quartiles.

The patient category data describes an MTF in terms of four general beneficiary categories using IPDS data. This adds to the interpretation of the case mix index by alluding to the types of diseases or injuries one could anticipate based upon the activity level or demographic features frequently associated with a given segment of the MTF catchment area population.

Lastly, age and sex data are displayed as categories with the respective percent of data attributed to each age/sex cell. This further facilitates explanation of the case mix index, in that, generally, the younger the population represented in the inpatient data the lower the complexity of the diseases and injuries treated. Conversely, the greater the percentage of

patients in the older age cells the higher the case mix index because of the presence of complicating and/or comorbid conditions and the higher relative weights associated with older Medicare patients in the HCFA Prospective Payment System.

4. Enclosure three is a record listing for the data from your facility for Major Diagnostic Category # 7 (only). The data elements displayed are:

Register Number	(7 digits)	(column 1)
DRG	(3 digits)	(column 2)
IPDS Clinic Svc	(2 digits)	(column 3)
FMP	(2 digits)	(column 4)
SSN	(9 digits)	(column 5)
Bed Days	(3 digits)	(column 6)

5. Enclosure four is a listing of the MDC # 7 records in a modified record format that allows you to see the recoded ICD-9-CM diagnoses and procedures and the MDC/DRG assignment.

6. The inpatient data used for this report were retrieved from the AMEDD Performance Measurement Study (PMS) data base for FY 84 (1 Oct 83-30 Sep 84). The IPDS data used in this study were converted from the International Classification of Diseases, Ninth Revision (ICD-9), 1977 and the International Classification of Procedures in Medicine,(ICPM), 1978 to the International Classification of Diseases, Ninth Revision with Clinical Modification (ICD-9-CM), 1979. This conversion was required in order to employ the Health Systems International Grouper Program, which assigns a DRG value to each record.

These data are still considered preliminary, because much work and research remain to be done to further refine the crossover between ICD-9 and ICD-9-CM. The refinement of the crossover will be completed within the next year. Moreover, The data in these reports are not intended to be used for external comparisons with civilian facilities.

7. Questions or comments concerning the data in these reports or the methods used to apply DRGs to AMEDD data should be addressed to either MAJ Stuart Baker or Mrs. Velda Austin, AMEDD Performance Measurement Study, Health Care Studies and Clinical Investigation Activity, Fort Sam Houston, TX 78234-6060, AV 471-5880/4880.

8. We hope these data will be useful for your research and would appreciate any input you have to our research project.

Chapter 1

INTRODUCTION

The purpose of this manual is to provide technical personnel with the detail necessary to install and understand the ICD-9-CM grouper so they may then debug, support and, if necessary, rewrite it. The first four chapters deal with the installation, testing and running of the grouper. Chapters 5 and 6 provide detailed information on the logic of the Executor and the construction of the tables.

The grouper, as it is currently written, may be implemented either as a set of subroutines to be called from a program written in a higher level language (e.g., COBOL) or as a utility program with all parameters passed through a job's SYSIN input stream. In preparing this manual, we made the following assumptions:

1. The reader is familiar with IBM OS Assembler.

2. The reader is familiar with IBM OS Job Control Language.

3. The reader is familiar with the ICD-9-CM coding scheme from a computer standpoint (e.g., diagnosis codes are five character alphanumerics which are usually left-justified in a five byte field and padded on the right with either blanks or zeroes).

4. For example purposes, the datasets required by the grouper are to be copied to disk and cataloged under the Userid GROUPER.

5. Volume serial numbers on the sample JCL will be replaced with the volume serial number of the transfer tape received by your installation. This number will be clearly indicated on the outside of the tape you receive.

Minimally, the ICD-9-CM grouper consists of three tables and two Assembler programs. The tables required by the grouper contain information for all valid diagnosis and procedure codes in the coding scheme. These tables were prepared from the CPHA ICD-9-CM codes and abbreviated description tape (December 1979 revision).

The grouper executor is contained in two Assembler programs. The data formats required by the executor are shown in Figure 1.1. The grouper may be implemented as a utility program if these data requirements are met (see Chapter 3). Whenever these requirements are not met, the grouper will have to be implemented as a subroutine to a higher level language program which recodes the information as necessary (see Chapter 4).

FIELD NAME	LENGTH IN BYTES	CODING
Diagnosis	5	Left-justified, padded with either blanks or zeroes, up to 15 accepted.
Procedure	4	Left-justified, padded with either blanks or zeroes, up to 15 accepted.
AGE	3	0 (zero) through 124, right justified.
Sex	1	1 through 2 1-male 2-female
Discharge Status	2	00 (zero) through 20 00-invalid 01-home, self-care 02-short term hosp. 03-SNF 04-ICF 05-other facility 06-home health service 07-against medical advice 20-died

Figure 1.1: Required Field Coding

The information returned by the Grouper is shown in Figure 1.2. The DRG and MDC numbers are simply the Diagnosis Related Group and Major Diagnostic Category numbers which have been assigned to the patient record. The Grouper return code indicates whether or not the grouping process was successful for a given record. It should be mentioned that return codes 3, 4 and 5 (invalid age, sex and discharge sta-

tus, respectively) will occur only for those DRGs for which they are part of grouping criteria (i.e., the Grouper does not perform an automatic edit check of these fields). We should also note here that the discharge status codes are those used for the UB-82 form.

Diagnosis (ADX and SDX) and procedure (MPR) codes will be returned by the Grouper whenever the grouping criteria involves a search of the patient's record for a particular set of codes. If the grouping criteria does not require any searching of the patient's diagnosis or procedure codes then the fields returned by Grouper will contain blanks. The version number (VCC) returned is for identification purposes. When users call HSI with potential problems, this identification number must be provided. Essentially, it tells the support staff at HSI which version of the grouper is installed, and aids in clearing up problems. When testing a grouping program, the programmer should use these fields to verify the correct grouping of input records.

FIELD NAME	LENGTH IN BYTES	DESCRIPTION
DRG	3	DRG number (1-470)
MDC	2	MDC number (0-24)
RTC	1	Grouper return code 0-record grouped 1-invalid principal dx 2-record does not meet criteria for any DRG in MDC as indicated by principal dx 3-invalid age, not 0-124 4-invalid sex, not 1 or 2 5-invalid discharge status 6,7,8,9- unused at present
MPR	4	ICD-9-CM procedure code used by Grouper
ADX	5	ICD-9-CM diagnosis code used by Grouper to satisfy "any diagnosis" grouping criteria
SDX	5	ICD-9-CM diagnosis code used by Grouper to satisfy "secondary diagnosis" grouping criteria
VCC	9	Version identification returned by Grouper.

Figure 1.2: Information Returned by the ICD-9-CM Grouper

APPENDIX O

TABLE 4

ALIGNMENT OF INTERMEDIATE OPERATING EXPENSE

ACCOUNTS AND BASES FOR ASSIGNMENT

ACCOUNT	BASES OF ASSIGNMENT
1. Depreciation of Equipment	As described in the Depreciation Account.
2. Command and Administrative Support Services	Ratio of each receiving account's number of full time equivalent man-months (excluding patients) to the total number of full time equivalent workmonth.
3. [1]Personnel Support Services	Ratio of each receiving account's square footage to the total square footage of the medical treatment facility.
4. [1]Public Works	
a. Plant Management, Operations of Utilities, Other Engineering Support and that portion of the Maintenance of Real Property which cannot be identified with a specific work center	a. Ratio of each account's square footage to the total square footage of the medical treatment facility.
b. Maintenance of Real Property and Minor Construction (including projects by contract not funded under 10 USC 2674A) which can be identified with a specific work center	b. Ratio of hours (or percentage) of service rendered to each receiving account to the total hours (or percentage) of service rendered to the medical treatment facility.

c. Leases and Rental of Real Property and Facilities	c. Ratio of each receiving account's square footage used to the total square footage leased or rented by the medical treatment facility.
d. Transportation Services	d. Ratio of hours of service received by each receiving account to the total hours of service received by the medical treatment facility.
5. Materiel Service	
a. All operating expenses except equipment maintained by contract or installation provided	a. Ratio of each receiving account's combined expenses for supplies (except subsistence) and minor plant equipment to total combined expenses for supplies (except subsistence) and minor plant equipment of the medical treatment facility issued by Materiel Service.
b. Equipment maintenance by contract or provided by the installation	b. Ratio of service rendered to each receiving account to the total service rendered to the medical treatment facility.
6. [1]Housekeeping and Janitorial Service	Ratio of hours of service rendered to each receiving account to the total hours of service rendered to the medical treatment facility.

7.	Biomedical Equipment Repair	
	a. Personnel, bench stock and shop equipment costs	a. Ratio of hours of service rendered to each receiving account to the total hours of service rendered to the medical treatment facility.
	b. Medical equipment maintenance contracts	b. Ratio of hours (or percentage) of service rendered to each receiving account to the total hours (or percentage) of service rendered to the medical treatment facility.
8.	Linen and Laundry Service	Ratio of pounds of dry laundry processed for each receiving account to the total pounds of laundry processed for the medical treatment facility. Pieces of laundry processed may be used as an alternate assignment basis only if to convert to pounds of dry laundry is prohibitive in cost, or prohibited by contract.
9.	Inpatient Food Service	Ratio of inpatient rations served to each receiving account to the total inpatient rations served in the medical treatment facility.

10. Inpatient Affairs	Ratio of occupied bed days in each work center to the total number of occupied bed days in the medical treatment facility.
11. Ambulatory Care Administration	Ratio of ambulatory patient visits to each receiving account supported for record maintenance to the total visits to those clinics.
12. Pharmacy	Ratio of weighted procedures requested by each receiving account to the total weighted procedures provided by the Pharmacy.
13. Pathology	Ratio of weighted procedures requested by each receiving account to the total weighted procedures provided by Pathology.
14. Radiology	Ratio of weighted procedures requested by each receiving account to the total weighted procedures provided by Radiology.
15. Central Sterile Supply/ Materiel Service	
a. Central Sterile Supply	a. Ratio of hours of service rendered to each receiving account to the total hours of service rendered by Central Sterile Supply.

	b. Central Materiel Service	b. Ratio of cost of supplies and equipment issued to each receiving account to the total cost value of supplies and equipment issued by Central Materiel Service.
16.	Surgical Services	Ratio of hours of service provided each receiving account to the total hours of service provided by Surgical Services.
17.	Same Day Services	Ratio of hours of service provided each receiving account to the total hours of service provided by Same Day Services.
18.	Special Procedures Services	Ratio of procedures requested by each receiving account to the total procedures provided by Special Procedures Services.
19.	Rehabilitative Services	Ratio of visits requested by each receiving account to the total number of visits provided by Rehabilitative Services.
20.	Nuclear Medicine	Ratio of weighted procedures requested by each receiving account to the total weighted procedures provided by Nuclear Medicine.

PATIENT ACUITY WORKSHEET

POINT VALUES	CRITICAL INDICATORS	ACUITY CODE
	VITAL SIGNS (MANUAL TPR, BP)	
(1)	Vital signs qid or less	1
(2)	Vital signs q4h or x 6	2
(4)	Vital signs q2h or x 12	3
(8)	Vital signs q1h or x 24	4
(2)	Rectal or axillary temp or apical pulse qid or more	5
(2)	Femoral or pedal pulses or FHT q4h or more	6
(2)	Tilt tests q4h or more	7
(6)	Post-op, post-partum, post-delivery (infants)	8
(3)	Vital signs q3h or x 8	9
	MONITORING	
(2)	Intake and output q8h	20
(8)	Intake and output q2h	21
(2)	Circulation or fundus checks q2h or x 12	22
(3)	Neuro checks q4h or x 6	23
(6)	Neuro checks q2h or x 12	24
(2)	CVP or ICP (manual) q2h or x 12	25
(6)	Cardiac/apnea/temp/pressure monitors (not cumulative)	26
(6)	Transcutaneous monitor	27
(4)	A-line or ICP (monitor) or Swan Ganz set-up	28
(2)	A-line or ICP (monitor) reading q2h or x 12	29
(2)	PAP/PA wedge reading q4h or x 6	30
(4)	PAP/PA wedge reading q2h or x 12	31
(2)	Cardiac output tid	32
	ACTIVITIES OF DAILY LIVING	
(6)	Infant/toddler care (≤ 5 years)	40
(2)	Self/minimal care (adult or child > 5 years)	41
(6)	Assisted care (> 5 years) - positions self	42
(14)	Complete care (> 5 years) - assist with positioning	43
(32)	Total care (> 5 years) - position and skin care q2h	44
(4)	Extra linen change and partial bath 2x per shift	45
(14)	Turning frame (2 staff to turn q2h)	46
(8)	Peds recreation/observation (0-12 years) (exclude NBN)	47
	FEEDING	
(5)	Tube feed adult/child/neonate q4h or x 6 (Bolus)	50
(10)	Tube feed adult/child/neonate q2h or x 12 (Bolus)	51
(6)	Adult meals > 5 years (spoon feed x 3)	52
(10)	Child meals < 5 years (spoon feed x 3)	53
(2)	Infant/neonate bottle x 1 feeding	54
(12)	Infant/neonate bottle q4h or x 6	55
(24)	Infant/neonate bottle q2h or x 12	56
(8)	Tube feed adult/child/neonate q3h or x 8	57
(2)	Tube feed (continuous) per bottle change	58
	IV THERAPY	
(4)	KVO (change bottle bid or less)	60
(4)	Heparin lock or Bravisc	61
(6)	Simple (change bottle tid or qid)	62
(6)	Complex (2 or more sites or change bottle q4h)	63
(2)	Medication q8h or x 3	64
(3)	Medication q6h or x 4	65
(4)	Medication q4h or x 6	66
(2)	Blood products (each administration)	67

NOTES:
1. For any treatment/procedure that requires multiple nursing staff to perform, multiply the critical indicator point value by the number of staff required.
2. Adjust points to accommodate frequency, i.e., intake and output q1h = 16.
3. Count only those procedures performed by the nursing staff.
